

A pellet boiler - almost too good for the boiler room

Protect the environment, heat without gas & oil and free yourself from the arbitrariness of the power companies: the PelletsUnit ETA PU fits into the smallest of rooms and brings reliable heat into the home with 7, 11 or 15 kW. It can be set up in any living space or utility room.

It looks good, works quietly and needs little space. Because the ETA PU heats with external air, it can be set up anywhere, not just in a boiler room.

All-inclusive saves installation costs

It fits on only 0.6 square metres and contains everything that a high-class heating boiler needs. Lambda control, heating circuit pump with mixer, expansion tank, safety fittings and the changeover valve for the hot water tank disappear behind the cover. Even the piping for a second heating circuit can be integrated into the boiler, if required. Not only does this look good, but it also makes the installation easy and cheap.

Control the heating by touchscreen

The entire heating system is comfortably controlled with a large touchscreen: switch on and off, change the heating times, check the pellet supply, check operation... Intuitively with self-explanatory images and symbols.

Remote control via mobile and PC

All heating system data is transferred to a mobile or PC via the www.meinETA.at platform. So you can just as easily control the heating from the sofa in the living room or from your vacation hotel or workplace. And if you suddenly remember on the way to the airport that the heating has to be turned down, that's also no problem: simply login via the internet ...
